

How to browse the internet from command line with Termux on Android

Note

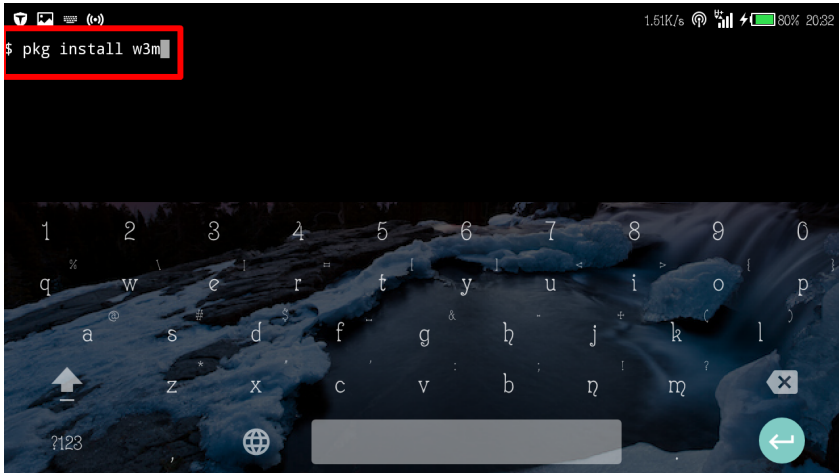

- Android rooting not needed

Follow The Below Steps

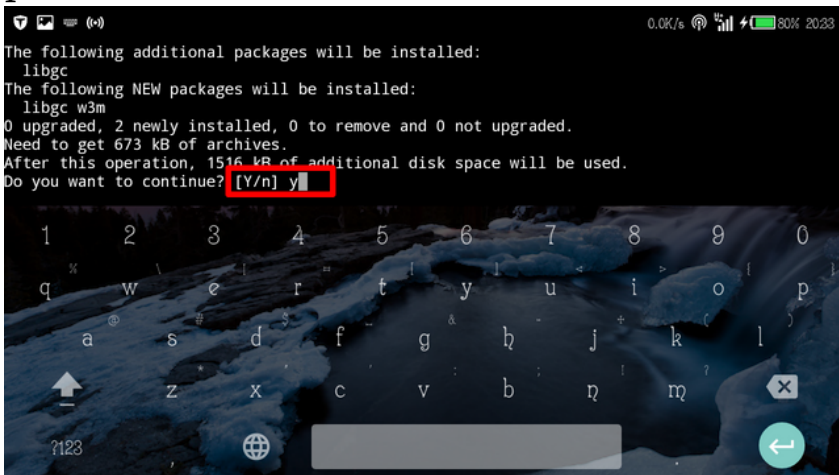

1: Just as usual, **Install and launch Termux**. Type this command `clear` then press **Enter** from your keyboard to delete every initial text on the screen.

2: type `pkg update` then press **Enter** from your keyboard.

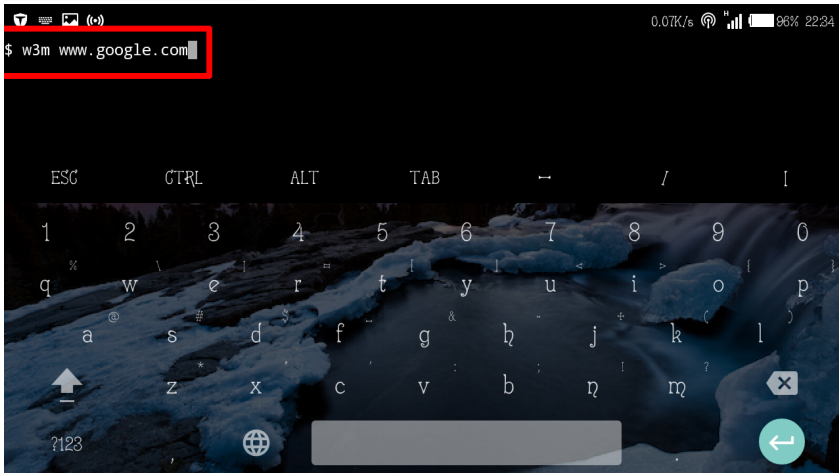

3: Now it's time to install **w3m** type `pkg install w3m` then press **Enter**

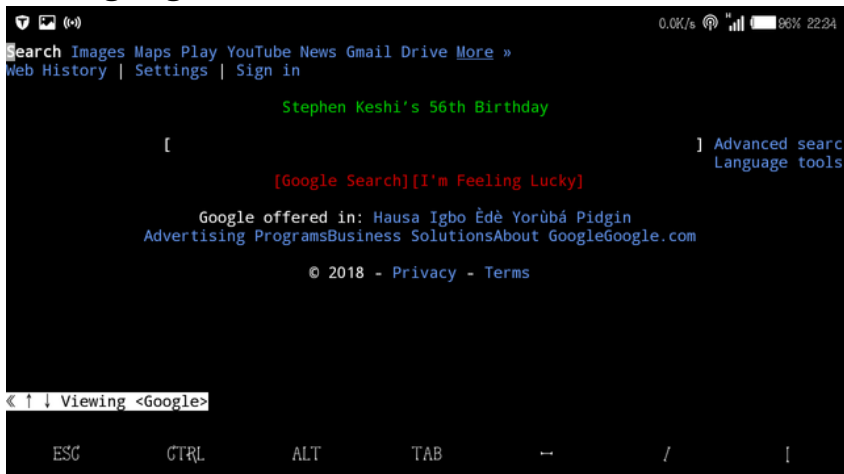

4: After typing the above code, you would be requested to reply with `Y/n` which stands for **yes/no**. Simply reply with `Y` to successfully install **w3m** then press **Enter**.

5: After successful installs, now its time to RUN **w3m** along side the url of our choice. Now type **w3m url** kindly replace the url with any website. For instance , If i want to access www.google.com , This is how the command entry'll look like **w3m** www.google.com then press **Enter** from your keyboard.

6: As you can see, we've have successfully accessed www.google.com via the command line.

NOTE

*The android keyboard automatically hides while browsing the net from the command line. Tap on the search space then press **Enter** from the keyboard. that code would you to type into google search engine.*

How to use the Keyboard while browsing via command line

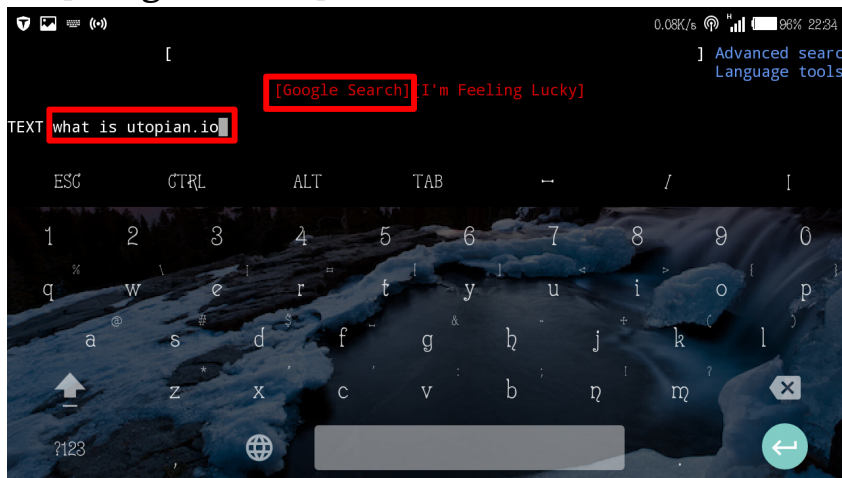

1: tap anywhere in the search space

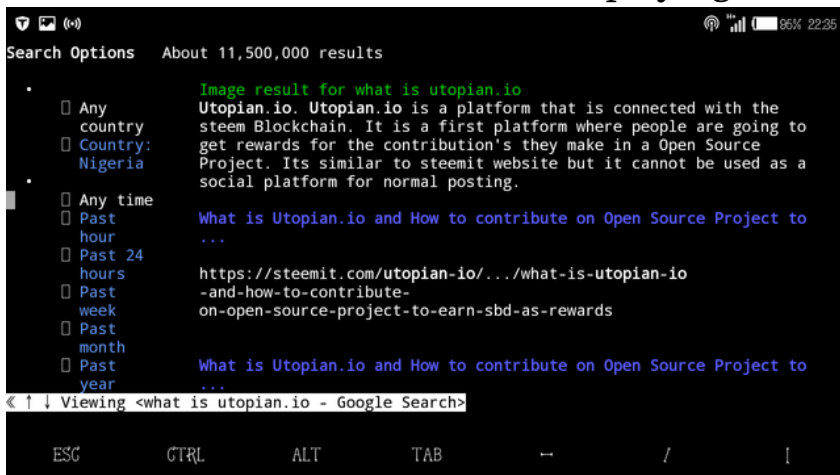

2: Simply slide from **Left** of your screen to **Right**, then tap on keyboard.

3: Type anything into the search engine. In my case i searched for **What is utopain.io** Then double tap on **[Google search]**

4: Now the search term result is displaying

- simply double tab on anyone of the results to open the source link.
